Natural Semantics

Properties of the Natural Semantics

Abstract Syntax of WHILE

We covered the semantics of arithmetic (\mathbf{Aexp}) and Boolean (\mathbf{Bexp}) expressions.

We still have to cover the semantics of statements (Stm).

Dealing with Change

The purpose of statements in **WHILE** is to change the state:

- ▶ the semantics of Aexp and Bexp only *inspect* the state
 - evaluation is side-effect free
- ▶ the semantics of **Stm** can *modify* the state
 - execution changes the state

Operational Semantics and State Change

- ▶ the execution of a program changes its state
- operational semantics are concerned with how to execute programs; not merely with the final results
- we are interested in how the states are modified during the execution
- ▶ therefore, operational semantics must model state change

Two Styles of Operational Semantics

What states are relevant?

- Natural Semantics (big-step semantics) describe how the overall results are obtained from initial to final state
- Structural Operational Semantics (small-step semantics) describe how the individual steps change the states (initial, intermediate, and final)

We model both operational semantics by transition systems.

Transition System

A transition system is a tuple $(\Gamma, T, \triangleright)$ where:

- ightharpoonup Γ is a set of **configurations**
- ▶ T a set of terminal configurations $T \subseteq \Gamma$
- ▶ \triangleright is a transition relation $\triangleright \subseteq \Gamma \times \Gamma$

Recall that the transition relation \triangleright is defined as $\triangleright \subseteq \Gamma \times \Gamma$.

Recall that the transition relation \rhd is defined as $\rhd \subseteq \Gamma \times \Gamma$. An alternative definition of \rhd is $\rhd \subseteq (\Gamma \setminus T) \to \Gamma$.

Recall that the transition relation \rhd is defined as $\rhd \subseteq \Gamma \times \Gamma$. An alternative definition of \rhd is $\rhd \subseteq (\Gamma \setminus T) \to \Gamma$. What's the difference?

Recall that the transition relation \rhd is defined as $\rhd \subseteq \Gamma \times \Gamma$. An alternative definition of \rhd is $\rhd \subseteq (\Gamma \setminus T) \to \Gamma$. What's the difference?

Configurations for WHILE

We define two types of **configurations**:

- \triangleright $\langle S, s \rangle$ statement S is to be executed from the state s, and
- s terminal or final state

A configuration of the latter form is a **terminal configuration**.

Configurations for WHILE

We define two types of **configurations**:

- \triangleright $\langle S, s \rangle$ statement S is to be executed from the state s, and
- s terminal or final state

A configuration of the latter form is a **terminal configuration**. The **natural** and **structural operational** semantics:

- \blacktriangleright use the same sets of configurations, Γ and T
- ▶ differ in the definition of the transition relation ▷.

Since WHILE is deterministic, we shall replace \triangleright by \rightarrow

Outline

Introduction

Natural Semantics

Properties of the Natural Semantics

Transition System for Natural Semantics

The Natural Semantics of WHILE is defined by a transition system (Γ, T, \rightarrow) where:

$$\begin{array}{rcl} \Gamma & = & \{\langle S,s\rangle \mid S \in \mathbf{Stm}, \ s \in \mathbf{State}\} \cup \mathbf{State} \\ T & = & \mathbf{State} \\ \rightarrow & \subseteq & \Gamma \times \mathbf{State} \end{array}$$

Fundamentals of Natural Semantics

- ▶ We are concerned with the initial and final states
- ▶ The transition relation \rightarrow specifies the relationship between the initial and the final states for each statement of WHILE
- ► The transition or judgement

$$\langle S, s \rangle \to s'$$

means that the execution of statement S from the initial state s will **terminate**, yielding the final state s'.

But how do we know it?

- ▶ Given a judgement $\langle S, s \rangle \rightarrow s'$, how do we know if it holds?
- For example, how do we know that

$$\langle \mathtt{y} := \mathtt{y} - \mathtt{1}; \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, [\mathtt{x} \mapsto 3, \mathtt{y} \mapsto 4] \rangle \to [\mathtt{x} \mapsto 4, \mathtt{y} \mapsto 3]$$

holds?

But how do we know it?

- ▶ Given a judgement $\langle S, s \rangle \rightarrow s'$, how do we know if it holds?
- For example, how do we know that

$$\langle \mathtt{y} := \mathtt{y} - \mathtt{1}; \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, [\mathtt{x} \mapsto 3, \mathtt{y} \mapsto 4] \rangle \to [\mathtt{x} \mapsto 4, \mathtt{y} \mapsto 3]$$

- holds?
- We define the transition relation → by a set of rules and axioms.
- ► These rules and axioms allow us to establish the **validity** of a judgement.

Rules and Axioms (I)

The definition of \rightarrow is given by a set of **rules** and **axioms**. A **rule** has the form:

[rule name]
$$\frac{\langle S_1, s_1 \rangle \to s_1', \ \cdots \ \langle S_n, s_n \rangle \to s_n'}{\langle S, s \rangle \to s'} \quad \text{if condition}$$

where:

- premises are written above the solid line
- ▶ the conclusion is written below the solid line
- $ightharpoonup S_1, \ldots, S_n$ are immediate constituents of S or constructed from immediate constituents of S
- a rule may also have a number of conditions or provisos that must be fulfilled for the rule to be applied
- if all the conditions and premises hold then the conclusion holds

Rules and Axioms (II)

The definition of \rightarrow is given by a set of **rules** and **axioms**. An **axiom** is a rule with no premises (may have conditions):

[axiom name]
$$\overline{\langle S, s \rangle \to s'}$$
 if condition

Natural Semantics for WHILE

$$[ass_{ns}] \qquad \langle x := a, s \rangle \rightarrow s[x \mapsto \mathcal{A}[\![a]\!]s]$$

$$[skip_{ns}] \qquad \langle skip, s \rangle \rightarrow s$$

$$[comp_{ns}] \qquad \frac{\langle S_1, s \rangle \rightarrow s', \langle S_2, s' \rangle \rightarrow s''}{\langle S_1; S_2, s \rangle \rightarrow s''}$$

$$[if_{ns}^{tt}] \qquad \frac{\langle S_1, s \rangle \rightarrow s'}{\langle if \ b \ then \ S_1 \ else \ S_2, s \rangle \rightarrow s'} \ \ if \ \mathcal{B}[\![b]\!]s = tt$$

$$[if_{ns}^{ff}] \qquad \frac{\langle S_2, s \rangle \rightarrow s'}{\langle if \ b \ then \ S_1 \ else \ S_2, s \rangle \rightarrow s'} \ \ if \ \mathcal{B}[\![b]\!]s = ff$$

$$[while_{ns}^{tt}] \qquad \frac{\langle S, s \rangle \rightarrow s', \langle while \ b \ do \ S, s' \rangle \rightarrow s''}{\langle while \ b \ do \ S, s \rangle \rightarrow s''} \ \ if \ \mathcal{B}[\![b]\!]s = tt$$

$$[while_{ns}^{ff}] \qquad \langle while \ b \ do \ S, s \rangle \rightarrow s \ if \ \mathcal{B}[\![b]\!]s = ff$$

Table 2.1: Natural semantics for While

The Assignment Statement :=

[ass_{ns}]
$$\langle x := a, s \rangle \to s[x \mapsto \mathcal{A}[a]s]$$

lacktriangle executed by updating the value of x in s with the value of the arithmetic expression a in the state s

Schema vs Instance

[ass_{ns}]
$$\langle x := a, s \rangle \to s[x \mapsto \mathcal{A}[a]s]$$

- ightharpoonup is a **schema**: x, s, and a are meta-variables
- we get an instance of the axiom when we replace the meta-variables by actual values, e.g.:

$$\langle \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[\mathtt{x} \mapsto 1]$$

assuming that $s_0 x = 0$

in general, we shall use axiom and rule to mean axiom schema and rule schema

The skip Statement

$$[skip_{ns}] \quad \langle skip, s \rangle \rightarrow s$$

lacktriangle does not modify the state s

The ; Statement

[comp_{ns}]
$$\frac{\langle S_1, s \rangle \to s', \quad \langle S_2, s' \rangle \to s''}{\langle S_1; S_2, s \rangle \to s''}$$

- sequential composition; imposes sequential order:
 - first execute S_1 from s, obtaining s'
 - ▶ then execute S_2 from s', obtaining s''

Assume that $s_0 x = 0$.

ightharpoonup is this an instance of $[comp_{ns}]$?

$$\frac{\langle \mathtt{skip}, s_0 \rangle \to s_0 \quad \langle \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[x \mapsto 1]}{\langle \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[x \mapsto 1]}$$

Assume that $s_0 = 0$.

ightharpoonup is this an instance of $[comp_{ns}]$?

$$\frac{\langle \mathtt{skip}, s_0 \rangle \to s_0 \quad \langle \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[x \mapsto 1]}{\langle \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[x \mapsto 1]}$$

▶ is this an instance of [comp_{ns}]?

$$\frac{\langle \mathtt{skip}, s_0 \rangle \to s_0[x \mapsto 5] \quad \langle \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0[x \mapsto 5] \rangle \to s_0}{\langle \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0}$$

Assume that $s_0 = 0$.

ightharpoonup is this an instance of $[comp_{ns}]$?

$$\frac{\langle \mathtt{skip}, s_0 \rangle \to s_0 \quad \langle \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[x \mapsto 1]}{\langle \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0[x \mapsto 1]}$$

▶ is this an instance of [comp_{ns}]?

$$\frac{\langle \mathtt{skip}, s_0 \rangle \to s_0[x \mapsto 5] \quad \langle \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0[x \mapsto 5] \rangle \to s_0}{\langle \mathtt{skip}; \mathtt{x} := \mathtt{x} + \mathtt{1}, s_0 \rangle \to s_0}$$

The if then else Statement

We need two rules, discriminated by a condition on the guard b:

$$[\mathrm{if}_\mathrm{ns}^\mathrm{ft}] \quad \frac{\langle S_1,s\rangle \to s'}{\langle \mathrm{if}\ b\ \mathrm{then}\ S_1\ \mathrm{else}\ S_2,s\rangle \to s'} \quad \mathrm{if}\ \mathcal{B}[\![b]\!]s = \mathrm{tt}$$

$$[\mathrm{if}_\mathrm{ns}^\mathrm{ff}] \quad \frac{\langle S_2,s\rangle \to s'}{\langle \mathrm{if}\ b\ \mathrm{then}\ S_1\ \mathrm{else}\ S_2,s\rangle \to s'} \quad \mathrm{if}\ \mathcal{B}[\![b]\!]s = \mathrm{ff}$$

recall that a rule can only be applied if the condition is true

We drop then, parenthesize b and get the rule:

$$[\text{if}_{\text{ns}}^{\text{tt}}] \quad \frac{\langle S_1, s \rangle \to s'}{\langle \text{if } (b) \ S_1 \ \text{else} \ S_2, s \rangle \to s'} \quad \text{if } \mathcal{B}[\![b]\!]s = \text{tt}$$

is this rule valid for C, C++, or Java?

We drop then, parenthesize b and get the rule:

$$[\text{if}_{\text{ns}}^{\text{tt}}] \quad \frac{\langle S_1, s \rangle \to s'}{\langle \text{if } (b) \ S_1 \ \text{else} \ S_2, s \rangle \to s'} \quad \text{if } \mathcal{B}[\![b]\!]s = \text{tt}$$

is this rule valid for C, C++, or Java?

Exercise

Speculative execution is an optimization technique where a computer system performs some task that may not be needed. Specify the natural semantics of the *eager execution* of the if then else statement.

The while Statement

We need an axiom:

$$[\text{while}_{\text{ns}}^{\text{ff}}] \quad \langle \text{while } b \text{ do } S, s \rangle \rightarrow s \quad \text{if } \mathcal{B}[\![b]\!] s = \text{ff}$$

and a rule:

$$[\text{while}_{\text{ns}}^{\text{tt}}] \quad \frac{\langle S,s \rangle \to s', \quad \langle \text{while} \ b \ \text{do} \ S,s' \rangle \to s''}{\langle \text{while} \ b \ \text{do} \ S,s \rangle \to s''} \quad \text{if} \ \mathcal{B}[\![b]\!]s = \texttt{tt}$$

- ▶ the axiom formalizes termination: if b is false the loop terminates and leaves the state unchanged
- ▶ the rule formalizes looping: if *b* is true we execute the body and continue from a modified state

The Natural Semantics of WHILE is not Compositional

► The culprit is the rule:

$$[\text{while}_{\text{ns}}^{\text{tt}}] \quad \frac{\langle S, s \rangle \to s', \quad \langle \text{while } b \text{ do } S, s' \rangle \to s''}{\langle \text{while } b \text{ do } S, s \rangle \to s''} \quad \text{if } \mathcal{B}[\![b]\!]s = \texttt{tt}$$

because the semantics of while is defined in terms of the very same construct; not a constituent of the construct

➤ This means we cannot apply induction on the structure of the statements

Derivation Trees

- \blacktriangleright to validate a judgement $\langle S, s \rangle \to s'$ we build a **derivation tree**
- ▶ the **root** is the proper judgement $\langle S, s \rangle \rightarrow s'$
- the leaves are instances of axioms
- ▶ the **internal nodes** are conclusions of instances of rules, with the corresponding premises as children
- the conditions of all the instantiated axioms and rules must hold
- ▶ a derivation tree is simple if it is an instance of an axiom; otherwise it is composite

How to Build a Derivation Tree

- lacktriangle Given a statement S and an initial state s we proceed from the root **upwards**
- Find an axiom or rule whose conclusion matches $\langle S, s \rangle$:
 - 1. If it is an axiom and the condition holds, determine the final state s'. We are done.
 - If it is a rule, recursively build derivation trees for the premises. Make sure that all the conditions hold and determine the final state.
- ▶ Note that, in general, the algorithm is **not deterministic**
- ► For WHILE, there will be at most one derivation tree

An Example of a Derivation Tree

For the statement (z:=x; x:=y); y:=z we get the derivation tree:

$$\langle z:=x; x:=y; y:=z, s_0 \rangle \rightarrow s_3$$

where s_0 x = 5, s_0 y = 7, s_0 _ = 0, and:

$$s_1 = s_0[\mathbf{z} \mapsto 5]$$

 $s_2 = s_1[\mathbf{x} \mapsto 7]$
 $s_3 = s_2[\mathbf{y} \mapsto 5]$

Exercises

Exercise. Build the derivation tree for the statement:

```
y := 1; while !(x = 1) do (y:= y*x; x:= x-1)
```

with an initial state s_0 such that s = 3.

Exercise 2.3 Build the derivation tree for the statement:

```
z := 0; while y \le x do (z := z+1; x := x-y)
```

with an initial state $s_0 = 17$ and $s_0 = 5$.

Termination and Looping

- ightharpoonup The execution of a statement S on a given state s
 - **terminates** if and only if there is a state s' such that $\langle S, s \rangle \to s'$, and
 - ▶ **loops** if and only if there is *no* state s' such that $\langle S, s \rangle \to s'$
- ► Therefore, note that no run-time errors are possible
- ▶ The execution of a statement S
 - always terminates if it terminates for all choices of s
 - ightharpoonup always loops if it loops for all choices of s

Exercises

Exercise 2.4 Consider the following statements:

- while !(x=1)do (y:= y*x; x:= x-1)
- ▶ while 1 <= x do (y:= y*x; x:= x-1)</pre>
- while true do skip

For each statement determine whether or not it always terminates and whether or not it always loops. Use the axioms and rules of the natural semantics to justify your answers.

Outline

Introduction

Natural Semantics

Properties of the Natural Semantics

Semantic Equivalence for Natural Semantics

Two statements S_1 and S_2 are semantically equivalent if for all states s and s':

$$\langle S_1, s \rangle \to s'$$
 if and only if $\langle S_2, s \rangle \to s'$

Proof Strategy: Proving Semantic Equivalence

Proving A if and only if B amounts to proving $A \Rightarrow B \land B \Rightarrow A$. To prove $\langle S_1, s \rangle \to s' \Rightarrow \langle S_2, s \rangle \to s'$:

- 1. Assume $\langle S_1, s \rangle \to s'$
 - Apply **rule inversion** to build (*stepwise, bottom-up*) a derivation tree \mathcal{D}_{S_1} for $\langle S_1, s \rangle \to s'$
 - ▶ The derivation tree \mathcal{D}_{S_1} yields some judgements J_1, J_2, \ldots known to be valid (given the assumption)
- 2. Prove $\langle S_2, s \rangle \to s'$
 - Using J_1, J_2, \ldots , apply axiom and rules to build (stepwise, top-down) a derivation tree \mathcal{D}_{S_2} for $\langle S_2, s \rangle \to s'$

To prove $\langle S_2, s \rangle \to s' \Rightarrow \langle S_1, s \rangle \to s'$:

► Follow steps 1 and 2 above in reverse direction (sometimes analogous)

Your proofs must adhere to this strategy.

Loop Unfolding for while

Loop unfolding or unrolling is a loop transformation technique that attempts to optimize a program's execution speed.

Lemma 2.5 The statement

```
while b do S
```

is semantically equivalent to

```
if b then (S; while b do S) else skip
```

Proof: By construction of valid derivation trees. You must prove both directions of the equivalence.

Exercises (I)

Exercise 2.6 Prove that the two statements S_1 ; $(S_2; S_3)$ and $(S_1; S_2)$; S_3 are semantically equivalent. Construct a statement showing that S_1 ; S_2 is not, in general, semantically equivalent to S_2 ; S_1 .

Exercise 2.7 Extend the WHILE language with the statement

```
repeat S until b
```

and define the relation \to for it. You are not allowed to rely on the while construct. Prove that repeat S until b and

```
S; if b then skip else (repeat S until b)
```

are semantically equivalent.

Exercises (II)

Exercise 2.8 Extend the WHILE language with the statement

```
for x := a1 to a2 do S
```

and define the relation \rightarrow for it. You are not allowed to rely on the while construct. Evaluate the statement:

```
y := 1; for z := 1 to x do (y := y*x; x := x-1)
```

from a state where x has the value 5. *Hint*: Assume that you have an inverse to \mathcal{N} to compute the numeral from a given number.

Deterministic Natural Semantics

A Natural Semantics is **deterministic** if for all choices of S, s, s^\prime , and $s^{\prime\prime}$ we have that

$$\langle S, s \rangle \to s'$$
 and $\langle S, s \rangle \to s''$ imply $s' = s''$

This means that for every statement S and initial state s we can uniquely determine the final state s' if (and only if) the execution of S terminates.

WHILE is Deterministic

Theorem 2.9 The Natural Semantics of WHILE is deterministic. **Proof:** We assume that $\langle S,\ s \rangle \to s'$ and shall prove that

if
$$\langle S, s \rangle \to s''$$
 then $s' = s''$.

We proceed by induction on the **shape** of the derivation tree for $\langle S, s \rangle \to s'.$

Induction on the Shape of the Derivation (Rule Induction)

To prove a universal property P on derivations trees:

- 1. Prove that the property P holds for all the *simple* derivation trees by showing that it holds for the **axioms** of the transition system.
- Prove that the property P holds for all composite derivation trees: for each rule assume that the property holds for its premises (induction hypothesis) and prove that it also holds for the conclusion of the rule, provided that the provisos of the rule are satisfied.

Exercise

Exercise 2.10 Prove that

```
repeat S until b
```

as defined in exercise 2.7 is semantically equivalent to

```
S ; while !b do S
```

Argue that this means that the extended semantics (i.e. the natural semantics extended to include repeat until) is deterministic.

The Semantic Function S_{ns}

The *meaning* of statements is given by the *partial* function:

$$\mathcal{S}_{\mathrm{ns}}:\mathbf{Stm} o (\mathbf{State} \hookrightarrow \mathbf{State})$$

This means that for every statement S we have a partial function:

$$\mathcal{S}_{\mathrm{ns}}[\![S]\!] \in \mathbf{State} \hookrightarrow \mathbf{State}$$

defined as:

$$\mathcal{S}_{\mathrm{ns}}[\![S]\!]s = \left\{ \begin{array}{ll} s' & \quad \mathrm{if} \ \langle S, \ s \rangle \to s' \\ \mathbf{undef} & \quad \mathrm{otherwise} \end{array} \right.$$

Quiz

We said that $\mathcal{S}_{\mathrm{ns}}$ is a partial function:

- ▶ Why is it a function?
- ► Why is it partial?

Quiz

We said that $\mathcal{S}_{\mathrm{ns}}$ is a partial function:

- ▶ Why is it a function?
- ► Why is it partial?

Exercises (I)

Exercise 2.11 The semantics of arithmetic expressions can be given by a natural semantics specification using the following two configurations:

- $ightharpoonup \langle a, s \rangle$ denoting that a is to be evaluated in state s
- ightharpoonup z denoting the final value $(z \in \mathbf{Z})$

The transition relation $\rightarrow_{\mathbf{Aexp}}$ has the form:

$$\langle a, s \rangle \to_{\mathbf{Aexp}} z$$

The inference rule for addition is:

$$\frac{\langle a_1, s \rangle \to_{\mathbf{Aexp}} z_1, \quad \langle a_2, s \rangle \to_{\mathbf{Aexp}} z_2}{\langle a_1 + a_2, s \rangle \to_{\mathbf{Aexp}} z} \quad \text{where } z = z_1 + z_2$$

Complete the transition system of the natural semantics and use structural induction to prove that this definition is equivalent to the semantic function \mathcal{A} .

Exercises (II)

Exercise 2.12 We can specify the semantics for Boolean expressions using natural semantics. The transitions will have the form:

$$\langle b, s \rangle \to_{\mathbf{Bexp}} t$$

where $t \in \mathbf{T}$. Specify the transition system and prove that the meaning of b defined in this way is the same as that defined by \mathcal{B} . **Exercise 2.13** Determine whether or not semantic equivalence of S_1 and S_2 amounts to $\mathcal{S}_{\rm ns} \llbracket S_1 \rrbracket = \mathcal{S}_{\rm ns} \llbracket S_2 \rrbracket$
